FOREWORD

Prior to 1935 this publication constituted the statistical sections of the Annual Report of the Chief of the Weather Bureau. The practice of publishing annual meteorological statistics in a separate volume, entirely disassociated from the Annual Report of the Chief of the Weather Bureau, was inaugurated in 1935 to avoid some duplication in printing, but primarily to make printed meteorological matter more accessible to the public and to conform with similar publications of foreign nations.

This publication was prepared by the Agricultural Section of the Division of Climatological and Hydrologic Services, through the cooperative assistance of approximately 5,500 voluntary climatic observers, the personnel at over 400 first-order Weather Bureau stations and 43 Climatological Section Centers, and many other Federal, State, and industrial agencies and individuals.

The discussions and statistics presented herein concern principally the climatological phase of meteorology. Statistical data relating to the work of all the Divisions of the Weather Bureau are published currently in the MONTHLY WEATHER REVIEW. From time to time special articles, based on the statistical data collected by the several Divisions of the Bureau, appear in the MONTHLY WEATHER REVIEW and its supplements.

GENERAL SUMMARY OF THE WEATHER CONDITIONS IN THE UNITED STATES DURING THE YEAR 1941

REVIEW OF WEATHER CONDITIONS DURING 1941

The most outstanding climatic feature of 1941 was lack of moisture in practically the entire region from Alabama, Mississippi, and northeastern Arkansas, northeastward over the Ohio Valley, and the Middle and North Atlantic States to Canada, in contrast to abnormally heavy precipitation in practically the entire region to the westward. It was the driest year of record in New England, New York, and Tennessee, and the second driest in Kentucky, Virginia, and Maryland-Delaware, with many stations reporting the most clear days and the least rainy days of record. On the other hand, it was the wettest year in the climatic history of New Mexico, western Texas, North Dakota, Colorado, Utah, and eastern Oregon; the second wettest in middle Texas, Arizona, Oklahoma, and Kansas; and the third wettest in California, Nevada, and Iowa. Among those sections reporting the greatest annual number of cloudy and rainy days ever recorded were California, Nevada, New Mexico, and eastern Montana. Illinois had its driest February to March period of record, and its wettest September and October, while Ohio reported the driest January to May period.

While people in sections of the dry eastern region were carrying water and occasionally fighting forest fires, those in the wet western sections were hampered in their planting, cultivating, and harvesting by excessive rains and were suffering because of floods. The drought that had prevailed in the eastern portion of the country since the first of the year was relieved considerably by rains in June and July, although in many cases it was only temporary relief. Kansas reported flood losses of \$12,500,000—their greatest on record; New Mexico, 24 lives, and \$4,000,000; Oklahoma, over \$6,000,000; and Arkansas, \$2,600,000. In Iowa, record rainfall in September and October caused wells that had been dry for 20 years to fill, and small streams that had been dry most of the time in recent years became bankfull.

A hurricane moved inland on the Texas coast near Matagorda on September 23d and passed northward over Houston, causing the loss of 4 lives and over \$6,503,300 worth of property in this State and \$2,500,000 damage in western New York which it reached on the 25th. There were also 2 hurricanes in Florida during October with property losses approximated at \$1,000,000.

Several heat waves occurred in the East, especially during April, May, and October, and in the north Pacific States, mostly during March and July; elsewhere, prolonged and severe hot or cold spells were absent. In North Dakota, the winter was so favorable that threshing was done as late as December 1941. In Iowa and Nebraska, grass and winter wheat remained green and were pastured almost to Christmas, while it was the first year in Missouri's climatic history that temperatures below zero were not registered. Lack of severe cold weather during the winter of 1940-41 in the South was blamed for large insect emergence, although a general freeze as late as March 2d extended southward to south-central Florida. Subzero weather appeared in many of the more northern States at the end of 1941.

A rather severe blizzard swept across Montana, North

Dakota, and northern Minnesota on March 15th and 16th, with a loss of 39 lives reported from North Dakota. Heavy duststorms occurred in Oklahoma during February, March, and June; the most severe was on February 12th, when visibility as far east as Oklahoma City was reduced to 400 feet, and at Cloud Chief, Okla., visibility was as low as 60 feet for a short time.

A remarkable aurora borealis was observed over the greater portion of the country as far south as northern Florida during the night of September 18th and 19th.

The mean temperature for the year 1941, derived by weighting the average temperatures of the several States according to their areas, was 54.1°, or only 0.9° above the average for the 1886 to 1941 period, during which time the highest annual average temperature for the United States was 55.6° in 1921, and the lowest, 51.8°, in 1917. Temperatures averaged below normal in Arizona, California, New Mexico, Utah, and Texas, while State averages in the northern interior ranged generally from 2° to 3° above normal. (See table 1.)

Maximum temperatures of 100° and over were reported from every State, except 5 in the New England group, with readings as high as 110° to 112° in the Great Plains. The highest temperature recorded was 120° at Cow Creek and Greenland Ranch, both in Death Valley, Calif. Temperatures as low as zero occurred as far south as Kentucky and Missouri in January, and Virginia and North Carolina in March. Freezing temperatures were reported from the Gulf States as late as March, with a minimum of 22° in northern Florida. The lowest temperature recorded in the United States for the year was -43° at Taylor Park, Colo., on January 3d.

The average annual precipitation, found by weighting the averages for all the States, was 32.42 inches or 3.37 inches more than the normal. It was the 3d wettest year of record, being exceeded only by 1905, with 32.79 inches and 1915, with 32.67 inches of precipitation.

Figure 1 gives the State percentages of normal precipi-

tation for the year; table 2, these percentages for the months and the year; table 3, the monthly and annual amounts; and table 4, the percentage of normal precipitation by States for the last 10 years. Chart 4, which is printed in the back of this publication, shows the areal distribution of total precipitation for the year 1941.

On the basis of total precipitation for the year, the wettest State was Louisiana, with 60.57 inches. Florida, with 58.34 inches was the only other State that had over 50 inches of precipitation. On a percentage basis, New Mexico was the relatively wettest State, with 195 percent of the normal annual amount. Other States showing over 50 percent more than the usual amount were Utah, with 163 percent; Nevada and California, with 154 percent each; and Arizona with 151 percent. Nevada, with 13.50 inches, was the driest State on the basis of total annual precipitation. The relatively driest States were Kentucky, Tennessee, Virginia, and the New England States, ranging from 22 to 27 percent less than normal.

The greatest annual precipitation at any station was 137.85 inches at Big Four, Wash. The greatest monthly amount was 34.21 inches at Squaw Creek, Calif., during December; this station received an annual total precipitation of 118.94 inches. Some of the greater total annual snowfalls were 525.5 inches at Wolf Creek Pass, Colo.; 474.9 inches at Crater Lake, Oreg.; 455.5 inches at Silver Lake, Utah; and 434.0 inches at Twin Lakes, Calif.

It is shown by Figure 2 that during the growing season, from April 1 to September 30th, the weather was relatively dry from Mississippi, northeastern Arkansas, and Missouri eastward and northeastward to the Atlantic coast. Only New England with 77 percent of normal and

New York with 78 percent received less than four-fifths of their usual precipitation during this period; but because dry conditions had prevailed east of the Mississippi River since the first of the year, conditions in these areas were more serious than the above figures would indicate. The copious rains in June and July afforded only temporary relief in many cases. However, these heavy rains coming so late in the season were very detrimental to cotton, chiefly by favoring excessive weevil activity and stalk growth. In South Carolina the yield of cotton was the lightest since 1878.

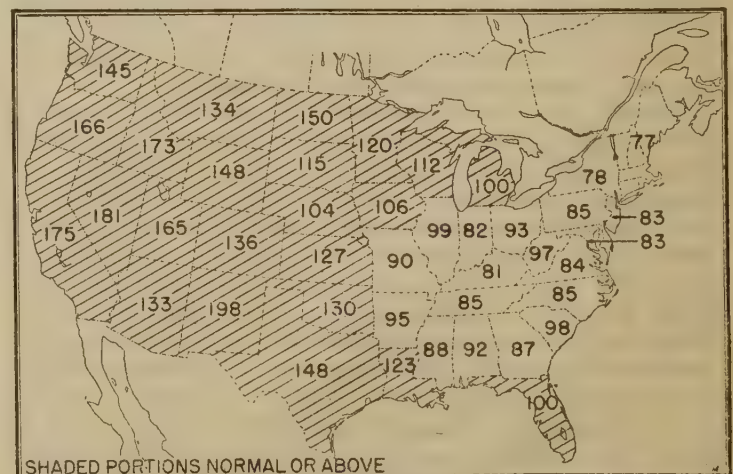

FIGURE 2.—Percentage of normal precipitation, April 1–September 30, 1941.

West of this dry area, excessive rainfall was quite general during the crop season, especially in New Mexico which received twice the normal amount. Crops suffered severely. For instance, it was reported from Louisiana and eastern Texas that many fields were flooded, levees broken, and cultivation and harvesting hampered. Cotton became sappy and weevil damage severe, and many fields of cotton, corn, rice, and truck produced disappointing yields or were abandoned. In spite of wetness, bumper crops of many kinds were harvested in most of the western portion of the country, and stockmen in the West enjoyed a favorable year.

Reference is made to charts in the back of this publication which present for the 1941 crop season the following: Chart 1,—Departure from Normal Temperature; Chart 2,—Total Precipitation; and Chart 3,—Departure from Normal Precipitation.

January.—January, as a whole, was abnormally warm everywhere, except in some of the more eastern States, principally in the Northeast. Monthly average temperature departures ranged from 3.2° below normal for New England to 5.3° above normal for Iowa. There were no extended severe cold periods. Zero temperatures occurred as far south as Kentucky during the month. Killing frost on the 20th extended to south-central Florida.

Precipitation was unusually heavy from the western Lake region southwestward over the western Plains and in California, with an average of 2.41 inches more than normal in eastern Kansas. Amounts were below normal in the Pacific Northwest, middle and northern Rocky Mountain regions, and from Louisiana, Arkansas, southeastern Missouri, and Indiana eastward over practically all of the Atlantic States north of Florida, and especially

in Mississippi and Tennessee. North Carolina and Georgia experienced the driest January since 1928.

February.—Mean temperatures were below normal from Pennsylvania and the southern Lake region southward over the Cotton Belt, except in central and western Oklahoma and western and northwestern Texas; average deficiencies exceeded 5° in the Southeast. Elsewhere, temperatures were generally above normal, with some States in the Rocky Mountains and Great Basin having plus departures of over 5°. It was the coldest February since 1912 in Florida, where freezing occurred southward to Hardee County on the 10th; while it was the 3d warmest February in Oregon and the 6th warmest in Nevada.

Rather dry weather prevailed from eastern Washington and central and eastern Oregon eastward over the northern portion of the country and thence southward over the South Atlantic and east Gulf Coastal Plains, except the Florida Peninsula, with average State deficiencies of 2 to over 3 inches between the Ohio Valley and the Gulf. It was the driest February of record in southern Ohio, 3d driest in Indiana, 5th driest in Wyoming, and the driest in Pennsylvania since 1901. Heavy to excessive amounts of precipitation occurred in the Florida Peninsula, Texas, Oklahoma, Arkansas, western Washington, and California, with Los Angeles reporting 12.42 inches which was its second wettest February of record.

March.—It was warm for the season from the Pacific coast eastward over the Great Basin and northern States to the Dakotas and northern Minnesota, and cold elsewhere. State averages were around 4° above normal in the far Northwest, while they ranged from near 4° to more than 6° below normal east of the Mississippi River and from Oklahoma and Missouri southward. The State of Washington reported the warmest March of record and the warmest December to March period, and Nevada set a new record for its highest temperature for March, with 102° at Overton. It was the 2d coldest March in South Carolina and West Virginia and the 3d in Virginia and North Carolina; also, the coldest March since 1932 in Oklahoma and Michigan. The most extensive freeze of the season reached south-central Florida on the 2d. A severe cold wave for so late in the season moved over the northern interior, beginning in eastern Montana as a widespread windstorm on the 15th and extending eastward as a severe blizzard to Michigan, with subzero readings as far south as Kentucky and North Carolina on the 16th and 17th.

Precipitation continued considerably below normal from eastern Washington and eastern Oregon eastward over the northern portion of the country and southward almost to the Gulf and was again heavy from California to Texas, in sections of the Gulf Coastal Plain, and in Florida and the eastern Carolinas. It was the 2d driest March in Indiana and Idaho. The least of record for the February-March period was reported from Missouri, Illinois, Indiana, Ohio, Pennsylvania, West Virginia, Kentucky, and Tennessee, with the Maryland-Delaware average equalling the previous least amount, while New Mexico and Arizona had more than twice their normals.

April.—April was cool for the season in central and eastern California, and from southern Idaho and southern Wyoming southward to Mexico and warmer elsewhere, with an average departure of minus 7° for northern Arizona and plus departures of over 6° for sections of the Lake region, Ohio Valley, and North Atlantic States. It was the 2d warmest April in New York, Pennsylvania, New Jersey, and Virginia, and the 3d warmest

in Indiana, with unusual warmth in the East from the 9th to the 20th.

Precipitation was generally below normal east of the Mississippi River and in the Pacific Northwest, and rather heavy in the western Plains and the Southwest, and in California, and southern Florida. New York reported the driest April since 1900 and the least April snowfall since records began in 1890, with many stations having the least number of rainy days. It was the driest April of record at Eastport and Portland, Maine, Concord, N. H., and Canton, N. Y. On the other hand, it was the wettest April at Key West, Fla., 3d wettest in California and South Dakota, and the 4th in Oklahoma.

May.—The weather of May was characterized by abnormally high temperatures throughout the interior of the country and by moderate warmth elsewhere. Arizona was the only State having a mean temperature below normal, with a departure of less than 1°. Several heat waves in eastern sections produced record-breaking maximum temperatures at many stations, especially in Virginia. It was the 6th warmest May in Wisconsin.

Precipitation was decidedly below normal in South Dakota and Nebraska, and from Missouri, Arkansas, and Mississippi eastward over the Atlantic States. It was the driest May of record in Alabama, Kentucky, and South Carolina, the 2d driest in Virginia, North Carolina, and Georgia, and the 3d driest in Florida. Crops suffered in eastern sections from the lack of moisture. A large southwestern area, centered in New Mexico and northwestern Texas, had heavy rains ranging up to 4 to 6 times the normal amounts. It was the wettest May of record in New Mexico and western Washington, and the record for wetness was equalled in Oregon.

June.—Mean temperatures by States ranged from 1° to 3° above normal from Missouri and Tennessee northward over the northern border States, and from 1° to 4° below normal from the western Cotton Belt and central western Plains to Oregon and California. Oklahoma had the coolest June since 1928 and the wettest since 1935.

Rainfall was abnormally heavy from the western Canadian border southward over Texas, along the Gulf, from eastern North Carolina to Florida, and from central Illinois to northern West Virginia, with unusual amounts in the Dakotas, Kansas, Oklahoma, Texas, South Carolina, and Ohio. It was the wettest June for eastern Oregon and the 2d wettest for South Carolina. Amounts were much below normal in Wisconsin, southeastern Missouri, and western Tennessee. Rains relieved, at least temporarily, the drought that had prevailed in most sections east of the Mississippi River.

July.—It was again generally warm in the northern and eastern portions of the country and in the central valleys, especially in Missouri, and cool in the Southwest. Many new records for continued heat and high temperatures were established in the Pacific Northwest.

Precipitation was much above normal from the Gulf to New England and mostly below in the north-central interior, with the usual marked local differences. Virginia had their 2d wettest July and the record for number of rainy days for the month was equalled. Cotton suffered the most severely as a result of these heavy rains.

August.—August was generally warmer than usual from the middle Canadian border southeastward over the middle and eastern Cotton States, and cooler in the Northeast and from Oregon to New Mexico. Some highest temperature records were established in the more northern interior States.

Precipitation was generally below normal from Neb-

raska and eastern South Dakota to the lower Ohio Valley and in the Atlantic States, and above in the northern border States from Michigan westward to the Pacific coast, in the middle Rocky Mountains, eastern Kansas, Oklahoma, and northwestern Texas. In eastern sections pastures were poor and many streams and wells were drying up because of the scanty rainfall, while in Idaho and eastern Oregon it was the wettest August on record.

September.—This month was much cooler than usual from the western Dakotas and Rocky Mountain States westward almost to the Pacific coast, and considerably warmer than normal over practically the entire region to the eastward. The average State deficiencies in mean temperature generally exceeded 4° in the Rocky Mountains, while the plus departures were approximately 3° from Tennessee to Michigan.

It was rather dry from Indiana and the lower Mississippi River eastward over the Atlantic States north of Florida, with amounts averaging around 2 inches below normal in Tennessee and from South Carolina to New Jersey. In New Jersey it was the driest September of record and in Pennsylvania the 2d driest. Unusually heavy precipitation occurred in the western Lake region, Illinois, and in all States west of the Mississippi River, except California and Nevada. It was the wettest September in the climatic history of Wisconsin, eastern North Dakota, Montana, western Oregon, and New Mexico, with the average for the last named State being the greatest ever recorded in any month in that State. Amounts were also heavy along the Gulf and in Florida.

October.—It was again considerably warmer than usual for the season in practically the entire region from the western Plains to the Atlantic and Gulf coasts, setting new records of highest temperatures for October at many stations in the East and Southeast. Cool weather continued in the Rocky Mountains, Great Basin, and eastern California. It was the warmest October of record in Virginia and Arkansas, and the 2d warmest in the Carolinas, Florida, Georgia, and Louisiana, while it was the coolest October since 1920 in Nevada.

Precipitation was below normal from Alabama northeastward over most of the Atlantic States and in a few far northwestern areas, while it was decidedly above in the central valleys, Southwest, Great Basin, and western Washington. Illinois, Kansas, Michigan, Oklahoma, Utah, and Missouri had the wettest October of record, and New Mexico, Indiana, and Iowa the 2d wettest.

November.—Temperatures averaged somewhat below normal from southern Texas and the middle Gulf to Arkansas and Tennessee, and above elsewhere, especially in northern sections where averages generally exceeded their normals by 3° to over 4°.

November was relatively dry in most sections, with Virginia, the Carolinas, and Texas receiving approximately one-half their usual amounts of rain. Precipitation was practically normal from the Rocky Mountains westward and in Iowa, Illinois, Michigan, and Mississippi. Florida, with 50 percent more than normal, was the only State that could be classed as wet. Heavy rains occurred in north Pacific areas.

December.—This month was warmer than usual in practically all sections and especially in the northern interior, where State averages ranged from 7° to over 9° above normal. Frosts and freezing temperatures did not extend below the northern counties of Florida. A cold wave appeared in the Pacific Northwest and northern Rocky Mountains at the close of the year.

Precipitation was below normal in the Dakotas and in

a strip of territory extending from Texas northeastward to Michigan and Pennsylvania, with Tennessee having a deficiency of nearly 2 inches; elsewhere, amounts were generally above normal. From 3 to over 4 inches more than the usual State averages fell in the Southeast and in California. Many middle and north Pacific stations received over 20 inches of rain. It was the 2d driest December in North Dakota, while in the Atlantic States the drought was effectively broken.

ALASKA

In the southern division of Alaska, temperature averaged 43.0° for 1941, or 2.1° above normal, precipitation, 80.58 inches or 5.70 inches below normal, and snowfall 58.5 inches or 40.3 inches less than normal. In the northern division, these values were 28.2° or 2.4° above, 13.55 inches or 1.09 inches below, and 44.1 inches or 14.9 inches below, respectively. The highest temperature during the year was 91° at Circle Hot Springs on July 14th and the lowest -65° at Fort Yukon on January 27th. Annual total precipitation ranged from 3.95 inches at Barrow in the Arctic to 206.10 inches at Latouche on the Gulf of Alaska. Forest fires caused considerable damage to spruce forests and destroyed many fur-bearing animals in the upper Koyukuk River area during the 3d week in June. Auroras were observed almost daily in some part of the Territory from September through March.

HAWAII

The average temperature for the year was 72.2° or 0.9° above normal. The highest monthly mean for the Territory was 76.2° in August and the lowest 68.1° in

February. The highest for any day was 96° at Mahukona, Hawaii, on August 14th and the lowest 18° at Haleakala, Maui, on February 9th. Precipitation for the group of Islands averaged 78.70 inches or 5.29 inches below normal. The most outstanding feature of the weather during 1941 was the almost unbroken dryness that prevailed over the Islands forming the northwestern portion of the group. This dryness extended over most leeward areas of the southeastern Islands of the group as well.

WEST INDIES AND CARIBBEAN SECTION

The mean annual temperature for 1941 was 80.1° or 1.1° above normal. The highest temperature recorded for the year was 100° at Tela, Honduras, in April and again in September; lowest was 47° at Central Ceballos and Central Elia, Cuba, in March. Annual rainfall during 1941 for the entire West Indies and Caribbean Section based on records of about 450 stations averaged 60.21 inches or 3.65 inches below normal. Fellowship, Jamaica, reported 210.67 inches of rain for the year; over $17\frac{1}{2}$ feet of water. The number of days with measurable rain during the year ranged from 34 in the southern Netherland West Indies to an average maximum of 307 days for two interior stations in Colombia, South America.

The second hurricane in this area during September sank the freighter, *M.S. Ethel Skakel*, north of Aruba, W. I., on the 25th, with the loss of 20 lives. It also caused serious loss of life and property in Honduras. Another storm in October killed 3 persons in the Bahamas before passing on to Florida. An earthquake on December 5th caused moderate property damage in many widely scattered localities in Costa Rica and Panama, but no casualties were reported.

TORNADOES, 1941

Tornadoes of 1941 are tabulated as follows: Table 5, tornadoes chronologically, monthly and annual, by States; table 6, tornado frequency, monthly and annual, by States; table 7, deaths and injuries, monthly and annual, by States; table 8, destruction in dollars, monthly and annual, by States; table 9, number, deaths, and property loss since 1916. These reports were furnished by Section Directors of the various States or sections, and accounts appear in the CLIMATOLOGICAL DATA of the respective States. There is also a preliminary report in the MONTHLY WEATHER REVIEW of December, 1941. The following tabulations may differ in some cases from previous reports of these storms, but this is due to more recent information used herein.

Tornado activity was considerably below normal during this year. The number of tornadoes reported was 117, or 23 less than the average for the 1916 to 1941 period. These occurred in 29 States. All but 22 were reported from the region extending from New Mexico, Texas, and Louisiana north-northeastward to the western Lake Region. Iowa had 24; Kansas, 19; and Texas, 12. California, Wyoming, and Utah, with 1 each, were the only States west of this area to report any. The one in Utah

was the first ever officially recorded in that State. There were 56 days during the year on which tornadoes occurred. Of these, 10 days were in April with 30 tornadoes, 10 in May with 16, 11 in June with 25, and 7 in October with 23.

The loss of life was 53 persons killed against a 26-year average of 239. Most of these deaths occurred in October and June, with 24 and 15 respectively. On October 26th, 19 people were killed in Arkansas and at least 95 injured when 20 homes were demolished at Dardanelle and 53 at Hamburg. It is estimated that 458 were injured during the year. At least 224 of these injuries occurred during October; of which number, 136 were from the Kansas storm of the 6th.

Total property loss was in excess of \$4,492,650 against a normal of over 11 million dollars. Only about \$52,500 of this loss was listed as crop damage. The greatest damage was in June, with over \$1,193,900 loss. On the 9th of this month in Lamb, Swisher, and Donley counties, Texas, tornadoes caused \$510,000 damage. They also caused property damage of \$425,000 in Minnesota on September 4th, and \$400,000 in New Jersey on August 25th.

TABLE 5.—Tornadoes of 1941, arranged by States

State and date	Hour	County	Direction of advance	Length of path	Width of path	Deaths	Injured	Property losses	Remarks

HAIL, 1941

This information about damaging hail during 1941 was assembled by the Section Directors of the various States, through the cooperation of observers, county agents, farmers, and insurance companies. Table 10 shows by States the crop and other property losses by hail for each month, for the April to September crop season, and for the year. These estimates are probably too low due to the many cases where the damage was reported in such terms as "considerable," "small," or "several thousand dollars." There is also the difficulty of separating hail damage from wind and rain damages. It is believed that the figures published in the Yearbooks maintain a constant ratio to the actual losses and that they are as close to the actual losses as possible to estimate under the conditions.

Crop and other property destruction by hail was reported from some State in every month, except November. Damage was practically confined to the April to September crop season, as should be expected, with less than \$9,000 or less than one-tenth of 1 percent of the total

losses, occurring during the remaining 6 months. Every Section reported damage, except Arizona, Louisiana, Mississippi, and West Virginia, with many others having only slight losses.

States in which hail damage exceeded one million dollars are Colorado, \$2,019,850; Florida, \$1,050,000; Iowa, \$2,649,434; Kansas, \$1,432,700; Minnesota, \$1,792,600; Montana, \$1,033,400; and North Carolina, \$1,030,570. The total for these 7 States is \$11,008,554, or 83 percent of the total hail losses for the entire country. Damage to crops in these 7 States was \$9,576,083, or 87 percent of the total damage in these States and 72 percent of the total damage in the United States.

Hail damage to crops and other property combined during the April to September crop season totalled \$13,294,730, exceeding the average of such losses for the past 10 years by about 50 percent. The crop damage during this season was \$11,446,309 or 86 percent of the total estimated loss of \$13,303,679 for 1941.

1 Moderate to heavy hail at various places, no damage reported.

2 Additional losses occurred, no accurate estimate obtainable.

3 Considerable losses occurred, no accurate estimate of damage available.

4 Losses occurred reported to be slight.

5 Damage estimated to be several thousand dollars.

6 Total damage for crop season; losses on a monthly basis not available.

NOTE.—Leaders in monthly columns indicate that no report of damage was received; this is not to be interpreted to mean that no hail occurred.

WINDSTORMS, 1941

Reports on damages, deaths, and injuries by windstorms were also furnished by the Section Directors for their respective States. Table 11 shows damage due to windstorms, other than tornadoes, to crops, and other property for each month, the crop season, and the year. Table 12 is a list of the number of people killed and injured by months and for the year in each section. Table 12A is a tabulation of deaths and property losses during the last 26 years.

Total damage to crops and other property during the year by nontornadic winds was estimated at \$15,523,320 or slightly less than half of the average for the 1916 to 1941 period. Of this amount over \$5,511,000 or approximately 35 percent was crop loss. These estimates are probably too low due to the fact that in some cases the damage was reported in such terms as "considerable," "small," or "several thousand dollars." Losses occurred in some States during each month of the year. Damage ranging from none to less than \$5,000 was reported from Alabama, Arizona, Colorado, Idaho, Louisiana, Mississippi, Nevada, Washington, and Wyoming; while dam-

ages exceeding \$6,539,900 occurred in Texas, \$2,514,000 in New York, and \$1,073,500 in North Carolina.

A tropical storm moved inland over eastern Texas on September 23d, killing 4 persons, causing \$4,320,000 damage to the rice crop and considerable damage to other crops, and destroying other property with additional losses of \$2,183,300. This storm did \$2,500,000 damage in western New York on September 25th, where it was reported as the worst storm in any September in that area. The loss of apples alone in western New York was estimated at 1,500,000 bushels. Another storm curved over Florida and Georgia on October 6th and 7th, doing damage estimated as exceeding \$675,000 in Florida, with no loss of life, and about \$250,000 damage in Georgia. A third tropical storm entered Florida on October 20th, where it did damage estimated at several hundred thousand dollars.

The loss of life was reported as 43 persons killed in the United States or about one-fifth of the normal number. Over 124 were injured.

SUNSHINE, 1941

Table 13 gives for 171 stations the monthly amounts of sunshine and percentage of the possible, as derived from the automatic records made by an instrument designated the "thermometric recorder," illustrated in preceding volumes of these series.

This instrument does not record satisfactorily the duration of sunshine for about 1 hour after sunrise and for about 1 hour before sunset, and on this account it has been considered necessary to apply to the record for these hours what has been designated a "twilight correction."

The amount of this correction is found by noting the comparative clearness of the sky during the time that elapses between the hour of sunrise and the moment the instrument begins to record and between the time the instrument ceases to act and the hour of sunset.

The average cloudiness of the whole sky is determined by numerous personal observations at all stations during the daytime, and is given in the column under "cloudiness" in the tables of Climatology, pages 33 to 127.

EXCESSIVE RAINFALL, 1941

Table 14 contains statistics of maximum amounts of rainfall during the calendar year 1941.

The method of tabulating excessive precipitation has been changed, beginning with the year 1936, to meet the needs of many sewage engineers.

The method heretofore used gave the accumulated depth of precipitation for each 5 minutes for a storm in which the rate of fall equaled or exceeded 0.25 inch in any 5-minute period or 0.30 inch in any 10-minute period, etc., and 0.80 inch in any 1-hour period, or 1.40 inch in 2 hours, the tabulation beginning with the 5-minute period where the rate of 0.05 inch in 5 minutes began and continuing for 5-minute periods up to 120 minutes.

The present method gives the maximum fall of precipitation for the periods 5 to 180 minutes, the maximum amounts being taken for the periods in which the fall is the greatest for the given time, and is tabulated to show the maximum amounts for 5, 10, 20, 30, 45, 60, 80, 100, 120, 150, and 180 minutes, even if the fall does not equal the excessive rate for some of the periods.

Table 14 shows for most stations of the Weather Bureau furnished with self-registering gages the maximum amounts of precipitation in 5, 10, 20, 30, 45, 60, 80, 100, 120, 150, and 180 minutes. The following Table A shows limits at which precipitation is considered as excessive for all stations except in the Southern States, including North

TABLE A.—Showing limits at which precipitation may be considered as excessive

Duration (in minutes)	Depth of precipitation (in inches)	Duration (in minutes)	Depth of precipitation (in inches)
5	0.25	35	0.55
10	.30	40	.60
15	.35	45	.65
20	.40	50	.70
25	.45	60	.80
30	.50		

Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee, Arkansas, Louisiana, Texas, Oklahoma, and San Juan, P. R.

This table is made up from the formula, $A = t + 20$, where A is the accumulated depth in hundredths of inches and t is the time in minutes.

For the Southern States, Table B is used. This table is made up from the formula, $A = 2t + 30$:

TABLE B.—Showing limits at which precipitation may be considered as excessive

Duration (in minutes)	Depth of precipitation (in inches)	Duration (in minutes)	Depth of precipitation (in inches)
5	0.40	40	1.10
10	.50	45	1.20
15	.60	50	1.30
20	.70	60	1.50
25	.80	80	1.90
30	.90	100	2.30
35	1.00	120	2.70

Similar data for the years 1896 to 1934, inclusive, have been presented in the appropriate annual reports of the Chief of the Weather Bureau, and for the years 1935–39 in appropriate issues of the United States Meteorological Yearbook. The published data prior to 1896 consist of a record of maximum amounts of rainfall in 5- and 10-minute periods, also in 1 and 24 hours. The annual report for 1895–96 contains a summary of the records which up to that time had been made at the principal stations supplied with automatic gages.

The excessive precipitation data for the years 1897–1935, inclusive, show the accumulated amounts of precipitation for each 5 minutes during all storms in which the rate of fall equaled or exceeded 0.25 inch in any 5-minute period, or 0.30 inch in any 10-minute period, or 0.35 inch in any 15-minute period, etc.

Normal standard time at the place of occurrence is employed in these tables.

TABLE 14.—Maximum precipitation for stated intervals during 1941 at all stations furnished with self-registering gages

NOTE.—The following stations had no excessive precipitation during the year 1941: New England States, Eastport, Maine, and Concord, N. H.; West Gulf States, San Antonio, Tex.; Northern Slope, Kalispell and Missoula in Mont.; Southern Slope, Yuma, Ariz.; Middle Plateau, Grand Junction, Colo.; Modena and Salt Lake City in Utah, Ely and Reno in Nev.; Northern Plateau, Baker, Oreg., Boise, Idaho, and Walla Walla, Wash.; North Pacific Coast Region, Roseburg, Oreg., and Seattle and

Tacoma in Wash., and none in Anchorage, Juneau, Fairbanks, Ketchikan, and Nome, Alaska.

Excessive precipitation data for the years 1931 and 1932 and for 1933 and 1934 appear, respectively, in the 1933-34 and 1934-35 issues of the REPORT OF THE CHIEF OF THE WEATHER BUREAU.

MONTHLY AND ANNUAL EVAPORATION, 1941

The monthly and annual amounts of evaporation during the year 1941 appear in table 15 below. The number of these reports at the present time is small, records appearing from a little more than half of the States.

The evaporation measurements are all made from cy-

lindrical pans, 4 feet in diameter, 10 inches deep, placed on framework laid on the ground, and exposed as far as possible to full sunshine. A description of equipment and methods of observation appeared in the MONTHLY WEATHER REVIEW of December 1916, pages 674 to 677.

ANNUAL METEOROLOGICAL SUMMARIES, 1941

MONTHLY AND ANNUAL METEOROLOGICAL SUMMARIES FOR 190 STATIONS FOR 1941

EXPLANATION OF THE TABLES

For a detailed account of the method of reducing the observed barometric pressures the reader is referred to the report on the barometry of the United States, Canada, and the West Indies, to be found in the Annual Report of the Chief of the Weather Bureau, 1900-1901, volume II; also see Article entitled "Adjustment of Airport Station Pressure Records to Old City Station Elevation" and tables, pages 33 to 35, UNITED STATES METEOROLOGICAL YEARBOOK, 1939.

Attention is called to the fact that the pattern of the Annual Meteorological Summary Tables has in many respects been modified and differs from the fixed arrangement adhered to in years previous to 1930. This change largely came about to make available to investigators additional information accrued by increasing the number of daily observations from two or three to a uniform system of observations at 6-hour intervals, 1:30 and 7:30 a. m. and p. m., 75th meridian time.

Pressure.—Two mercurial barometers of the well-known Fortin cistern pattern, or a modified form thereof, are furnished each station. One of these, the station barometer, is used in making all regular observations; the other, the extra, is held in reserve for use in case of emergency, except that monthly comparative readings are made on the two instruments for purpose of check upon the deterioration of either instrument.

Each barometer, before issue to station, is compared with the substandard at Washington, and a certificate-of-correction card furnished showing the several constant corrections that must be applied to the readings of the instrument in order to derive therefrom the actual pressure of the air in standard units at a specified elevation. Each observation as made, therefore, is corrected by the application of the following:

(1) Correction of scale error, capillarity, etc.

(2) Correction to standard gravity, comprising both latitude and altitude terms.

(3) Correction for removal—a correction applied if any change has been made in the elevation of the barometer, to reduce the readings to the elevation adopted in 1900. (However, at a very few stations the elevation of 1900, or the original elevation of a station opened since 1900, has been replaced as the "station elevation" by an actual elevation since established.)

Corrections 1, 2, and 3 are constant for any one station and are combined in a single sum.

(4) Correction for the temperature of the scale and mercurial column.

In the pressure columns of this part the values presented are those at the station elevations of the barometer cisterns, which are at various heights above the ground level, but usually less than 100 feet. On the other hand, daily weather maps and most other pressure data issued by the Bureau indicate sea-level pressures.

The monthly mean pressures given in the summary are deducted from the corrected observations of pressure at 7:30 a. m. and 7:30 p. m., seventy-fifth meridian time,

by taking the mean thereof and applying thereto a correction to reduce to the mean of 24-hourly observations. At several Alaskan stations the mean is printed uncorrected. The extremes are determined, wherever possible, from the barograph trace.

Temperature.—The temperature of the air at 1:30 and 7:30 a. m. and p. m., seventy-fifth meridian time, is obtained by the use of the whirled dry-bulb thermometer. The latter is part of the whirled psychrometer and is mounted in the thermometer shelter adopted in 1885.

The maximum temperature is obtained by the use of the Negretti and Zambra mercurial thermometer, having a constriction in the bore of the tube below the scale. The minimum temperature is obtained by the use of the ordinary Rutherford alcohol minimum thermometer. Both instruments are read once or more daily. The extremes given in the summaries are for the civil day, midnight to midnight, normal standard time. The monthly means have been obtained by dividing the sum of the mean maximum and mean minimum temperatures by 2.

Moisture.—The snow caught and retained in the gage is melted and measured as water. No correction is applied for snow that is lost out of the gage by the eddying action of the wind; consequently, in some cases the record is less than would be given if the observer had measured cylinders of snow cut from the spots representing the average snowfall on the ground. When it is known that the catch of the snow gage is markedly at fault, an independent ground measurement is made and used as the official record. The loss of both rain and snow caused by high winds, from gages exposed on the roofs of tall buildings in which some of the regular stations of the Weather Bureau are located, is undoubtedly larger than is the case at the cooperative stations where the gages are located in the open country and near the ground, but this loss does not appear to be sufficient to make the monthly sums derived from these two classes of stations wholly inconsistent with each other.

By the maximum precipitation in 24 hours is meant the greatest measurement for any 24 consecutive hours; it does not refer to the rate of rainfall for 24 hours, as deduced from short, heavy showers.

The number of days with precipitation amounting to 0.01 and 0.04 inch, respectively, relates to the rainfall from midnight to midnight, standard of time in local use. No record is made of deposits of dew.

The total snowfall column presents the depth as unmelted snow. The month in this instance runs from the last observation of the preceding month to the last observation of the month itself.

The cloudiness recorded in the summaries is derived from personal observations. The proportion of sky covered by clouds from sunrise to sunset is estimated by the observer on a scale of 0-10.

The monthly means of the dew point and relative humidity are given as computed directly from the original daily observations.

The rain gages used at the regular Weather Bureau stations have a circular catchment area of about 8 inches diameter, and the snow, hail, or sleet caught within them

is melted and measured as water. The rain gage proper is set within an enclosing cylinder, which serves as an overflow attachment in the case of heavy rains and as a snow gage in the winter season.

The sum total of the depth of rain and melted snow is measured to within 0.01 inch at time of daily observations. The total precipitation is determined from the amounts recorded daily, midnight to midnight, standard of time in local use.

The number of days that were clear, as given under "Number of days, etc.," includes those on which the daylight cloudiness was 0-, 1-, 2-, or 3-tenths; the days partly cloudy were those on which the daylight cloudiness was 4-, 5-, 6-, or 7-tenths; the cloudy days were those having 8-, 9-, or 10-tenths of cloudiness during daylight.

Wind.—The direction and velocity of the wind are recorded at nearly all the stations on what is known as the "triple register." On these instruments the direction of the wind is recorded every minute. The maximum velocities given are for 5-minute periods.

Beginning with January 1, 1932, the Weather Bureau began the practice of applying corrections to all records of wind velocity obtained from rotating cup anemometers. Correction tables for both three-cup and four-cup anemometers having been made available to stations and hence values furnished to the public are on a comparable basis, regardless of the particular instrument employed.

Number of days.—The number of days with hail includes all of those on which at least a trace of hail fell.

The number of days with light, moderate, thick and

dense fog includes all of those on which fog occurred according to the following classifications: Light fog, horizontal range of visibility is not less than $\frac{5}{8}$ mile, (3,300 feet); moderate fog, horizontal range of visibility lies within the limits, $\frac{5}{16}$ mile (1,650 feet) to (but not including) $\frac{5}{8}$ mile; thick fog, horizontal visibility lies within the limits, $\frac{1}{5}$ mile (1,000 feet) to (but not including) $\frac{5}{16}$ mile (1,650 feet), and dense fog, horizontal visibility is reduced to less than $\frac{1}{5}$ mile (1,000 feet).

Time.—In this part the time indicated is seventy-fifth meridian time, except in a few instances where footnotes specify otherwise.

References and abbreviations.—H=official elevation of station=height of the ground above sea level at station; H_b =height of barometer cistern above mean sea level on January 1, 1900, or when the station was established, if it was established since January 1, 1900, that being the elevation to which all previous readings have been reduced. It is designated as the "station, or adopted elevation." At almost all stations where a change has been made in the elevation of the barometer since January 1, 1900, a corresponding correction has been applied to the observed reading, thereby reducing all values to the "station, or adopted elevation." The actual elevation and the station, or adopted elevation, are identical, except at stations where the barometer has been moved since January 1, 1900, H_t =height of thermometer above ground; H_r =height of rain gage (top) above ground; H_a =height of anemometer (cups) above ground.

Chart 1.—Departure from Normal Temperature, in Degrees Fahrenheit, for the Crop Season of 1941, March 1 to September 30.

[Shaded portions show excess (+) and unshaded portions deficiency (—) of temperature. Figures show mean daily excess (+) or deficiency (—) of temperature over areas bounded by light lines]

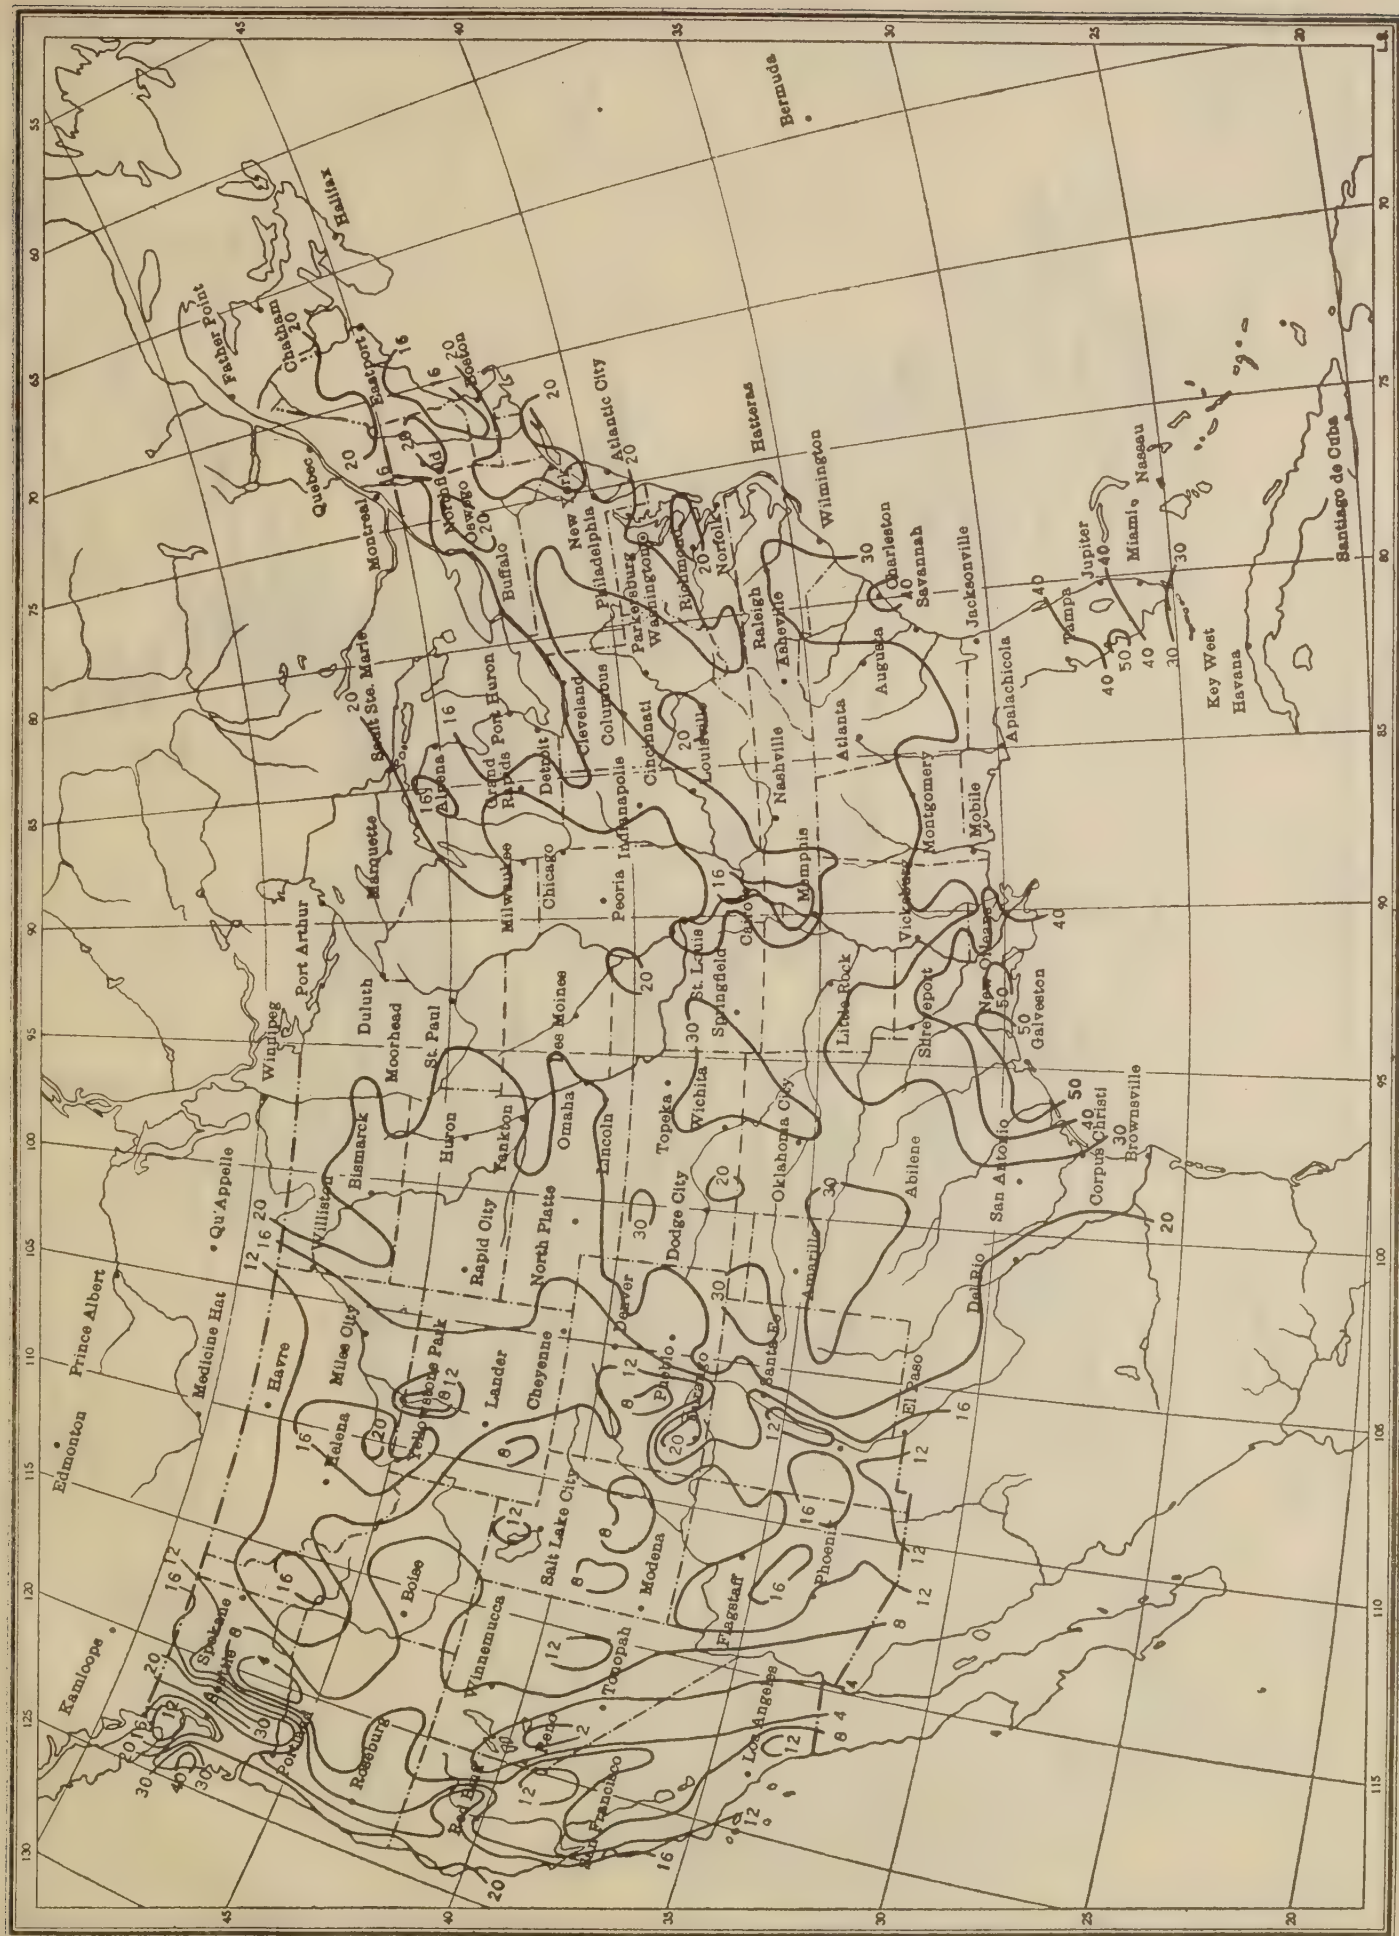

Chart 2.—Precipitation, Inches, for the Season of 1941, March 1 to September 30.

130

[Shaded portions show excess (+) and unshaded portions deficiency (—) of precipitation. Figures show, in inches, amount of excess or deficiency of precipitation over areas bounded by light lines]

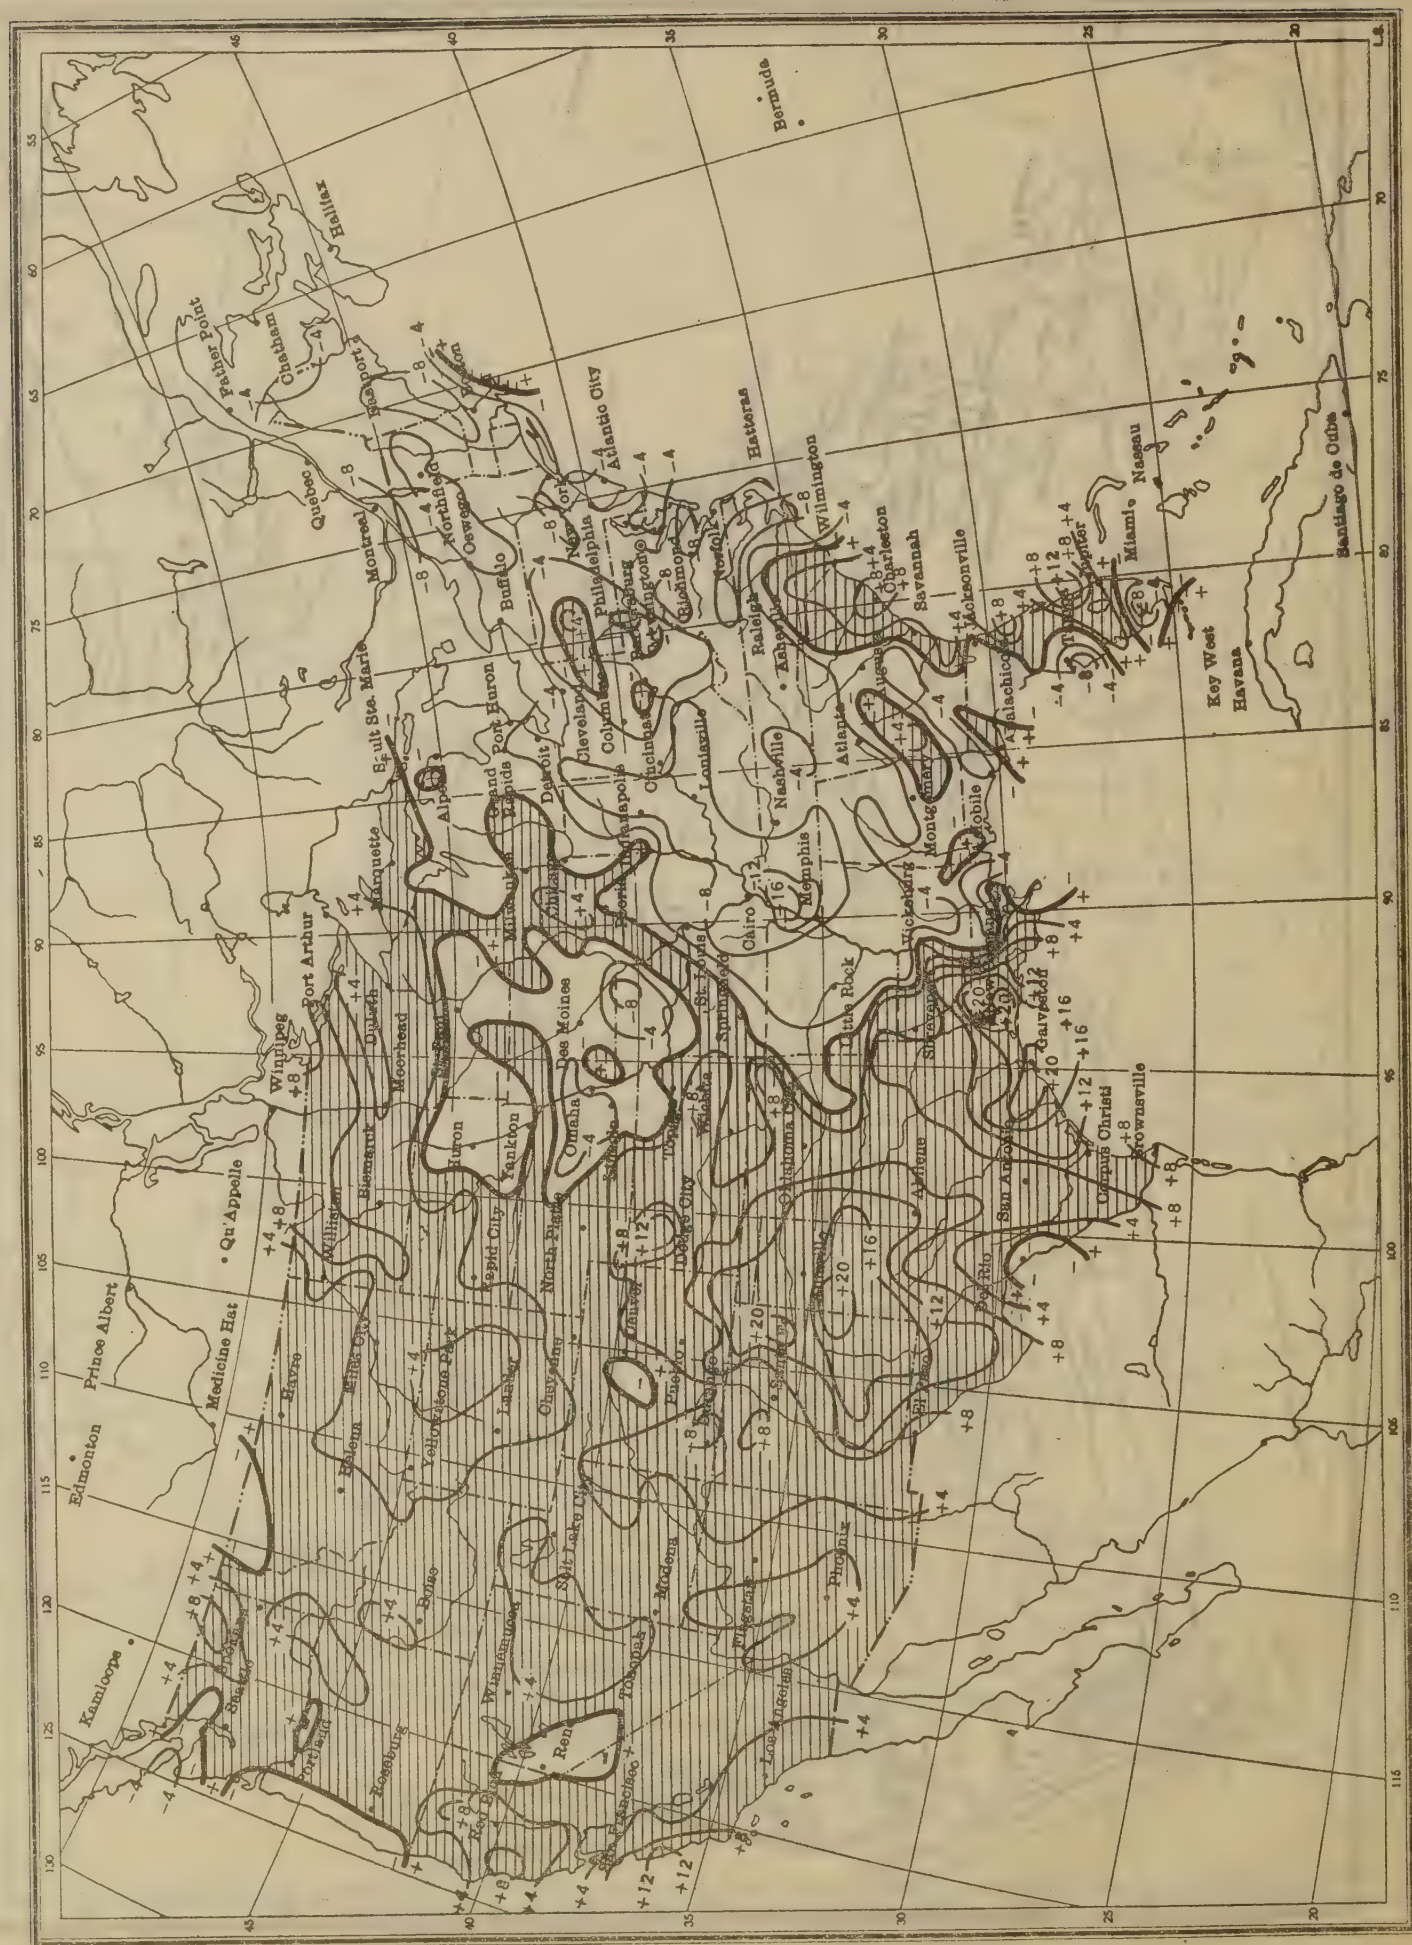

Chart 4.—Total Precipitation, Inches, for the Year 1941.
